

Physics: Newton's First Law

Newton's First Law of Motion states that an object at rest stays at rest, and an object in motion stays in motion at constant velocity unless acted upon by a net external force.

This law is also called the law of inertia. Inertia is the tendency of an object to resist changes in its motion.

Example: A book resting on a table remains at rest until a force, such as a person pushing it, causes it to move.

Example: A moving ball continues moving in the same direction unless a force such as friction or a collision changes its motion.
